

- ❖ **Beehive:** L.L. Langstroth discovered the principle of bee space in 1851 in the U.S.A. The bee space measures 9.52 mm for *A. mellifera*, and this was modified for *A. cerana* to be between 7 and 9 mm.

TERMS RELATED WITH APICULTURE

❖ Swarming

- It is the natural instinct of honeybees to reproduce its colonies.
- By swarming strong colonies are divided naturally.
- It occurs mostly when the colony population is at its peak.

❖ Causes:

- Overcrowding and lack of ventilation.
- Presence of old queen.
- Sudden honey flow.
- Lack of space for egg laying and honey storage

❖ Absconding:

- It is the **total desertion of colony** from its nest due to incidence of disease/pest attack, too much interference by human beings or robbing of honey by bees from other colonies.
- Proper hive management can prevent it.

❖ Trophallaxis:

- It is food transmission (exchange of food).
- Common between workers and also from workers to queen and drones.
- Communication regarding availability of food and water and a medium for transfer of pheromone.

❖ Indian bee: *Apis cerana indica*.

❖ European bees [Italian bees]: *Apis mellifera* (It is known to be resistant to TSBV)

❖ *A. m. capensis* **cape bee**: unique thing, laying workers treated as queen (pseudo-queen) but do not mate.
